Impact of Large-Scale Tropical Precipitation Anomalies on the Overturning and Interior Watermass Structure of a Coupled Climate Model

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

Presentation at LOM Meeting, June, 2009

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

from Dai (2006)

Annual precipitation $(mm \, day^{-1})$ from observations (top) and CM2.1 (bottom) 1979-1999.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

CM2.1 (and CM2G) has too much precip over Indonesia and too little over the Amazon basin and the Tropical Atlantic.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

Biased Freshwater Flux estimate $FWT^*_{Indonesia} \approx 1.2 FWT_{Indonesia}$ (0.2Sv) displaced from the tropical Atlantic.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

Surface buoyancy $(-\rho g)$ flux $(kg m^{-1} s^{-3})$ due to heating and freshwater,

$$F_{b} = g \left(\alpha c_{p}^{-1} Q + \beta S(0) F_{w} \right)$$
$$Q = Q_{sw} + Q_{lw} + Q_{evap} + Q_{sensible}$$
$$F_{w} = Precip - Evap + Runoff + Calving \qquad (1)$$

Estimated freshwater flux bias,

$$FWT_{Indonesia}^{*} = \int_{Indonesia} F_{w}^{*} dx \, dy = 1.2 \, FWT_{Indonesia}$$
$$FWT_{TrAtl}^{*} = FWT_{TrAtl} - 0.2 \, FWT_{Indonesia}$$
(2)

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

CM2G* biased

CM2G^{adj} adjusted

 $CM2G^* - CM2G^{adj}$

Atlantic haline buoyancy forcing $(10^{-4}kg m - 1s^{-3})$ in *CM*2*G*^{*} (yr1-100) (left), adjusted (middle), biased-adjusted (right).

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

CM2G* biased

CM2G^{adj} adjusted

 $CM2G^* - CM2G^{adj}$

Atlantic thermal buoyancy forcing $(10^{-4}kg m - 1s^{-3})$ in *CM*2*G*^{*} (yr1-100) (left), adjusted (middle), biased-adjusted (right).

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

Implied ocean northward freshwater transport (biased - adjusted) in units of Sv (top). Implied ocean heat transport in units of PWatts (bottom). Model years 1-100.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

Simple scaling argument for AMOC,

$$-\Delta\Psi(B_{in}-B_{out})=\int_{Atl}\Delta F_b(x,y)dxdy,$$
(3)

where, $\Delta \Psi$ and ΔF_b are change in strength of the AMOC and buoyancy forcing respectively. B_{in} and B_{out} are the buoyancy of the surface and deep branch:

$$B_{in} - B_{out} = -g \left(
ho_{in} -
ho_{out}
ight) \ pprox 10 kg m^{-2} s^{-2}$$

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

Haline (top) and Thermal (bottom) forced $\Delta \Psi$ (Sv). Assuming no change in storage. Net change $\approx 4Sv$. Model years 1-100.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

Eulerian overturning streamfunction max at 45N stronger by ≈ 2.5 Sv over the first two centuries in CM2G*. The buoyancy estimate is ≈ 4 Sv.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

- The response of CM2G to a 0.2 Sv change in the tropical inter-basin atmospheric freshwater transport yields \approx 2.5 Sv change in the strength of AMOC.
- Partial compensation of haline-driven overturning change by thermal feedbacks.
- The change in the overturning circulation brings with it a change in the basin thermohaline structure.
- Column integrated bias in CM2G is dominated by a warm/salty North Atlantic. We attribute this to atmospheric moisture transport bias.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

SALT

Column integrated salinity bias (*psu m*,), years 300-399.

SALT

M.J. Harrison and R. Hallberg and A. Adcroft

SALT

NOAA/GFDL

Column integrated temperature bias (° C m), years 300-399.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

lole of Buoyancy Forcing

CM2G* - CM2G^{adj} 0-500 SALT (psu)

CM2G* - CM2G^{adj} 0-500 TEMP (degC)

0-500m sensitivity years 300-399.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

CM2G* - CM2G^{adj} 500-1000 SALT (psu)

CM2G* - CM2G^{adj} 500-1000 TEMP (degC)

500 - 1000m sensitivity years 300-399.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

CM2G* - CM2G^{adj} 1000-2000 SALT (psu)

CM2G* - CM2G^{adj} 1000-2000 TEMP (degC)

1000 - 2000m sensitivity years 300-399.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

CM2G* - CM2G^{adj} 2000-3000 SALT (psu)

CM2G* - CM2G^{adj} 2000-3000 TEMP (degC)

2000 - 3000m sensitivity years 300-399.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

CM2G* - CM2G^{adj} 3000-3500 SALT (psu)

CM2G* - CM2G^{adj} 3000-3500 TEMP (degC)

3000 - 3500m sensitivity years 300-399.

M.J. Harrison and R. Hallberg and A. Adcroft

NOAA/GFDL

- CM2 Walker Cell bias: Excessive atmospheric moisture transport to Indonesia from Amazon.
- Results in stronger AMOC (\approx 2.5 Sv per 0.2 Sv change in atmospheric FWT).
- AMOC sensitivity is consistent with change in haline buoyancy forcing with partial compensation from thermal forcing.
- AMOC-induced change in vertical watermass structure.
- CM2G North Atlantic temperature (warm) and salinity (salty) bias is attributed to Walker Cell bias.
- There are long time scale adjustments involving transport from the North Atlantic to the Southern Ocean as well as shallow circulation adjustments in all basins.
- We emphasize the importance of an accurate tropical hydrological cycle in coupled models to the ability to simulate and predict the overturning circulation and ocean watermass properties.
